Olafsen,2019-07-26 The original work by M D Sturge has been updated and expanded to include new chapters covering non equilibrium and biological systems This second edition re organizes the material in a more natural manner into four parts that continues to assume no previous knowledge of thermodynamics The four divisions of the material introduce the subject inductively and rigorously beginning with key concepts of equilibrium thermodynamics such as heat temperature and entropy The second division focuses on the fundamentals of modern thermodynamics free energy chemical potential and the partition function The second half of the book is then designed with the flexibility to meet the needs of both the instructor and the students with a third section focused on the different types of gases ideal Fermi Dirac Bose Einstein Black Body Radiation and the Photon gases In the fourth and final division of the book modern thermostatistical applications are addressed semiconductors phase transitions transport processes and finally the new chapters on non equilibrium and biological systems Key Features Provides the most readable thorough introduction to statistical physics and thermodynamics with magnetic atomic and electrical systems addressed alongside development of fundamental topics at a non rigorous mathematical level Includes brand new chapters on biological and chemical systems and non equilibrium thermodynamics as well as extensive new examples from soft condensed matter and correction of typos from the prior edition Incorporates new numerical and simulation exercises throughout the book Adds more worked examples problems and exercises
