Biology Gustavo Stolovitzky,Pascal Kahlem,Andrea Califano,2009-05-18 At a microscopic level organisms are ruled by interacting systems of biomolecules Historically scientists painstakingly elucidated chains of molecular events using experiments that reveal individual interactions although they recognized that members of different pathways frequently interact In recent years researchers have built richer interconnected networks to mathematically summarize their knowledge of these interactions This systems biology enterprise largely stimulated by high throughput tools like microarrays that measure mRNA levels as an indicator of gene expression is a vital and increasingly important activity in both basic biology and in medicine A nagging concern however is how accurately these networks represent the biology For complex systems like biological networks there are practical limits on how well even massive amounts of data can uniquely define the underlying structure and yield useful predictions of measurable events Indeed although its advocates call this process reverse engineering the topology and the detailed molecular interactions of the inferred networks will likely never be known with precision This volume captures the ongoing process to assess the ability of scientists and their computer servants to infer networks from experimental data by comparing their predictions to gold standard networks whose structure is thought to be known NOTE Annals volumes are available for sale as individual books or as a journal For information on institutional
