Elements Of Functional Analysis Graduate Texts In Mathematics V 192:

Elements of Functional Analysis Francis Hirsch, Gilles Lacombe, 2012-12-06 This book arose from a course taught for several years at the University of Evry Val d'Essonne. It is meant primarily for graduate students in mathematics. To make it into a useful tool appropriate to their knowledge level prerequisites have been reduced to a minimum: essentially basic concepts of topology of metric spaces and in particular of normed spaces, convergence of sequences, continuity, compactness, completeness of abstract integration theory with respect to a measure, especially Lebesgue measure, and of differential calculus in several variables. The book may also help more advanced students and researchers perfect their knowledge of certain topics. The index and the relative independence of the chapters should make this type of usage easy. The important role played by exercises is one of the distinguishing features of this work. The exercises are very numerous and written in detail with hints that should allow the reader to overcome any difficulty. Answers that do not appear in the statements are collected at the end of the volume. There are also many simple application exercises to test the reader's understanding of the text and exercises containing examples and counterexamples, applications of the main results from the text or digressions to introduce new concepts and present important applications. Thus the text and the exercises are intimately connected and complement each other.

Advanced Łukasiewicz calculus and MV-algebras D. Mundici, 2011-06-22 This is a continuation of Vol 7 of Trends in Logic. It will cover the wealth of recent developments of Łukasiewicz Logic and their algebras, Chang MV algebras with particular reference to de Finetti's coherent evaluation of continuously valued events, Rényi conditionals for such events, related algorithms.

Partial Differential Equations: Modeling, Analysis and Numerical Approximation Hervé Le Dret, Brigitte Lucquin, 2016-02-11 This book is devoted to the study of partial differential equation problems both from the theoretical and numerical points of view. After presenting modeling aspects, it develops the theoretical analysis of partial differential equation problems for the three main classes of partial differential equations: elliptic, parabolic, and hyperbolic. Several numerical approximation methods adapted to each of these examples are analyzed: finite difference, finite element, and finite volumes methods, and they are illustrated using numerical simulation results. Although parts of the book are accessible to Bachelor students in mathematics or engineering, it is primarily aimed at Masters students in applied mathematics or computational engineering. The emphasis is on mathematical detail and rigor for the analysis of both continuous and discrete problems.

Functional Analysis in Asymmetric Normed Spaces Stefan Cobzas, 2012-10-30 An asymmetric norm is a positive definite sublinear functional p on a real vector space X . The topology generated by the asymmetric norm p is translation invariant so that the addition is continuous, but the asymmetry of the norm implies that the multiplication by scalars is continuous only when restricted to non-negative entries in the first argument. The asymmetric dual of X , meaning the set of all real-valued upper semi-continuous linear functionals on X , is merely a convex cone in the vector space of all linear functionals on X . In spite of these differences, many results from classical functional analysis have

their counterparts in the asymmetric case by taking care of the interplay between the asymmetric norm p and its conjugate. Among the positive results one can mention Hahn-Banach type theorems and separation results for convex sets. Krein-Milman type theorems, analogs of the fundamental principles, open mapping, closed graph, and uniform boundedness theorems, an analog of the Schauder's theorem on the compactness of the conjugate mapping. Applications are given to best approximation problems, and as relevant examples one considers normed lattices equipped with asymmetric norms and spaces of semi-Lipschitz functions on quasi-metric spaces. Since the basic topological tools come from quasi-metric spaces and quasi-uniform spaces, the first chapter of the book contains a detailed presentation of some basic results from the theory of these spaces. The focus is on results which are most used in functional analysis: completeness, compactness, and Baire category, which drastically differ from those in metric or uniform spaces. The book is fairly self-contained, the prerequisites being the acquaintance with the basic results in topology and functional analysis, so it may be used for an introduction to the subject. Since new results in the focus of current research are also included, researchers in the area can use it as a reference text.

Infinite Dimensional Teichmüller Spaces and Moduli Spaces Ėge Fujikawa, 2010 **Multivalued Maps And**

Differential Inclusions: Elements Of Theory And Applications Valeri Obukhovskii, Boris Gel'man, 2020-04-04. The theory of multivalued maps and the theory of differential inclusions are closely connected and intensively developing branches of contemporary mathematics. They have effective and interesting applications in control theory, optimization, calculus of variations, non-smooth and convex analysis, game theory, mathematical economics, and in other fields. This book presents a user-friendly and self-contained introduction to both subjects. It is aimed at beginners, starting with students of senior courses. The book will be useful both for readers whose interests lie in the sphere of pure mathematics as well as for those who are involved in applicable aspects of the theory. In Chapter 0, basic definitions and fundamental results in topology are collected. Chapter 1 begins with examples showing how naturally the idea of a multivalued map arises in diverse areas of mathematics, continues with the description of a variety of properties of multivalued maps, and finishes with measurable multivalued functions. Chapter 2 is devoted to the theory of fixed points of multivalued maps. The whole of Chapter 3 focuses on the study of differential inclusions and their applications in control theory. The subject of last Chapter 4 is the applications in dynamical systems, game theory, and mathematical economics. The book is completed with the bibliographic commentaries and additions containing the exposition related both to the sections described in the book and to those which left outside its framework. The extensive bibliography, including more than 400 items, leads from basic works to recent studies. *Dynamical Systems and Differential Equations* Shouchuan Hu, Xin Lu, Weiqing Xie, 2005 *Scientific and Technical Books and Serials in Print*, 1984
